

Overview

Modular In Line TAMs are designed to plug directly into the DSLAM between the DSLAM port socket and the cable plug. Ideal for fitting at installation time or retro fit to in service units.

UTEL can supply modular In-Line TAM for a wide range of current and superseded DSLAMs. A Switch Module can be made for most DSLAM's currently in service and UTEL would be happy to design a unit if it does not already exist in our product range.

UTEL has supplied in excess of 2 Million lines of module in-line TAM to date. It is suitable for both Incumbent and Competition Local Exchange Carriers. (OLEC & CLEC). Additional features such as surf & test and test and talk are also available. These options allow testing to take place with the DSL link still operating and/or the voice service still in use.

UTEL TASM is an industrial strength solution. Advanced self-test facilities are built in as standard and we also have proven planning and installation processes available to facilitate mass rollout programmes. Our web based Element Manager software and free laptop site verification applications ensure data integrity.
